Permanent Link to 2017 Leadership Awards honor the best in the GNSS industry
2021/05/14

Event photos by Melanie Beus The GPS World Leadership Awards were presented during a special ceremony and dinner during ION-GNSS+ 2017 in Portland in September. The awards recognize significant recent achievement in these fields of positioning, navigation and timing: satellites, signals, services and products. The Leadership Dinner was made possible by our generous sponsors: Harris Corporation, Rockwell Collins and Spirent Federal Systems. 2017 dinner program cover. (Image: GPS World) Opening remarks by Alan Cameron, editor and publisher of GPS World Everyone at this great conference is actively engaged in innovation: new approaches, new combinations, new integrations, new methodologies. Our sponsors are not only innovators, they are active in building those innovations in the field, installing the cornerstones of GPS and GNSS technology. Harris Corporation has been building the GPS satellite payloads since the beginning of time, Rockwell Collins has built so much user equipment, historically and currently, and Spirent Federal Systems has been enabling the development and testing of much user equipment by many companies in this room. Just to give you an idea of who else is seated among you at the tables, we have NovAtel, Spectracom, IFEN, Septentrio, Satelles, Syntony, Unicore, u-blox, ComNav, RaceLogic, Rohde & Schwarz, ublox, Locata, GMV, Leica, Thales, Boeing, Broadcom, Qualcomm, Google, Apple, Intel, MITRE and Aerospace Corporation; the U.S. Air Force GPS Directorate, the U.S. State Department, the European Space Agency, the European GNSS Agency and the European Commission, NASA, the French and German aerospace agencies; the Institute of Navigation and the Royal Institute of Navigation; and universities and research institutes almost too many to number. This is a great industry to be part of, and I feel lucky to be kind of a spectator, a commentator in it without the benefit of the scientific upbringing that everybody else in this room has had. I still get to participate in the excitement and the developments and for that I am truly grateful. Satellites Leadership Award Galileo Builder Wolfgang Paetsch Director of Navigation and Member of the Executive Board, OHB For his leadership in setting up the routine production of the Galileo satellites leading to Galileo constellation deployment, including the quadruple Ariane 5 launch in November 2016. Paul Verhoef (right), director of the Galileo

Programme and Navigation-related Activities, European Space Agency, accepted the award and delivered remarks on behalf of Wolfgang Paetsch. (Right photo: Melanie Beus) Introduction by Rob Scott, Rockwell Collins "Forty years ago, Rockwell Collins celebrated the first receipt of a GPS signal, using a six-foot tall, two-person receiver. Now we have something something 1 by 1-1/4 inches that is far more capable. It's amazing to see how technology has advanced." Remarks by Wolfgang Paetsch I must admit I am rather at fault for Wolfgang not being here, because I keep him rather busy producing satellites, as OHB is completing the last of 22 satellites under contract from ESA. We are going to launch again in December, as you know we have had a few problems, which I'm glad to say we have solved. The issues are behind us, and the Swiss clocks are working fine now, which is great. On Dec. 12 we are going to launch. The first two satellites are in Kourou already, the next ones are going in two weeks [as of Sept. 28; all satellites are now in Kourou. — Ed.] We're going to go up on an Ariane 5 again, with these four satellites. Next summer we are doing another four, so it brings the whole Galileo constellation from 18 to 26, and then we are fully operational. In this business it is quite a challenge to keep up the pace. I think OHB, with Wolfgang in the lead, has done very well in the past years to set up indeed a very impressive production line and keep all the machinery ticking over. It has been a big challenge for them, as they had been a relatively small player in the space business, while at the same time they have been able to win other competitions in the space business in other areas. OHB has been doing very well and we are glad of course that they are doing well because it was important to get Galileo up and running. OHB has managed to win recently another contract, good for them, we are about ready to give them the first options on that contract, so we will have a total of 14 satellites under contract with them, in addition to the 22 they are completing. These satellites will further complete the constellation and they will already start replacing the first IOV satellites which we have put up. So you see the cycle is rather quick. Of course we are waiting a bit to see what the real lifetime of the satellites is going to be. We don't know that yet but we will find out in the next couple of years. Looking Ahead. So what are the challenges for us in the next years? We are currently working with colleagues from the European Commission and the European GNSS Agency on what the next constellations are going to do. Obviously there is a lot of pressure for further innovation, for further improvements. The user community over the last couple of years has become more outspoken about what they want and what they expect, which is nice. Obviously we need to take care of the legacy users, and we are having to see what new technology would allow us to do. At the end of the day there is then also a small thing called budget, which needs to have its play in these things. In any case, the plan is by the end of the year we will start the procurement of the next batch of satellites. This will take a while to do, this procurement, as it concerns new developments, but then we are going to go for the next constellation. So let me finish by paying a tribute to Wolfgang and his team. It has been a real challenge for them. I know that he was pretty amazed, and after that pretty proud, of this prize he has gotten, and I will carefully carry this back to him in Europe. Alan, thank you very much. Services Leadership Award Global Educator Patricia Doherty Director and Senior Scientist, Institute for Scientific Research, Boston College For initiating and leading the African GNSS Outreach program since 2009, to help developing countries derive social and economic benefits from satellite-based PNT.

Frank van Diggelen (left, above), an African Outreach faculty member and principal software engineer, Google, introduced and conferred the award to Pat Doherty. (Photo: Melanie Beus) Introduction by Frank van Diggelen "I had the great honor and privilege of teaching in the African GNSS Outreach program. If you are approached to participate in this, seize the opportunity! It's a fabulous thing, with people from all over Africa, and you'll learn far more than you think." Remarks by Patricia Doherty I would like to thank GPS World for this Leadership Services Award. I am sincerely honored and humbled by this recognition. Serving the GNSS community with the African Outreach Program has been a joy and a privilege that I am personally grateful for every day. This program began in 2009. The idea was conceived at a G8-UNESCO World Forum that I was fortunate to attend in 2007. At that forum, leaders from developing nations of Africa described the need for assistance in developing science and technology in their countries, technologies that would lead the way to socio-economic transformation and integration into the world economy. As all of us here know, GNSS is a space technology that can change the world with applications that can increase food security, monitor natural resources, manage wildlife conservation, improve emergency location services, and provide greater precision and safety in land, sea and air navigation — just to name a few of the possibilities. Thus the goal of the African Outreach Program was to encourage the use of GNSS for societal and economic development and for scientific exploration in Africa. The way to do that was to help build a knowledgeable African GNSS workforce. I am glad to report that the program has been quite successful. To date, we have hosted 9 workshops. In those workshops, we have introduced the art and science of GNSS navigation to over 450 professors and students from at least 23 of the 54 countries in Africa. Many of the African participants have gone on to do great things: hosting local workshops, developing GNSS programs in their universities, gaining government confidence and interest in GNSS technology and building infrastructure that enabled the use of GNSS. One of the prime reasons for this success are the sponsors who support us and the lecturers who generously share their time, their knowledge and their zeal for GNSS to teach at the workshops. Many of these lecturers are here tonight. So thank you all. Many of these lecturers have expressed that their lives were enriched by this program. Others have told me that they have never seen a more attentive audience and that just having the opportunity to meet and work with people from the developing world in Africa is a gratifying experience. Several of our lecturers, including myself, are now involved in collaborations with scientists in the developing world. More to come. Although this sounds like we have done our job, there is still so much to do. Change is slow in Africa. Our plans for the future include building on our success by hosting additional workshops where we will try to reach additional countries in Africa and strengthen current programs and infrastructure in countries where that has been slow to develop. We are also opening the program to other developing countries around the world, as there has been much interest from Central America, South America and Asia. Finally, we are working to bring more workshops to the African continent, where we can reach more students, have an effect on local universities and speak to the local government about the benefits of using GNSS as an enabling technology for societal betterment and economic growth. In closing, I am honored to receive this award and I look forward to continuing our work to support the use of GNSS in developing nations. Thank you, GPS World, and thank you to our

sponsors, lecturers and our African participants for making this program a success. Signals Leadership Award Spectrum Advisor Chris Hegarty Director for Communications, Navigation and Surveillance Engineering and Spectrum, The MITRE Corporation For contributions to the U.S. Department of Transportation's GPS Adjacent Band Compatibility Assessment. Chris Hegarty (Photo: Melanie Beus) Introduction by Joe Rolli, Harris Corporation "On behalf of the Harris Corporation and the team I work with in the Precision Navigation and Timing Business Area, providing the world with GPS signals from space for over forty years, I am pleased to present this year's Leadership Signals Award." Remarks by Chris Hegarty Thank you very much. I really appreciate this. The truth be told, of course, the Adjacent Band Compatibility (ABC) study has had many contributors. I'm honored to receive this award, but equally deserving are many others including Karen Van Dyke at DOT, Steve Mackey and Hadi Wassaf at DOT's Volpe Center, Karl Shallberg at Zeta, and too many others to list at DOT, the Air Force, NASA, other federal partners and their contractors. Looking forward, for those of you who have not been following this issue, the GPS spectrum is being challenged. The spectrum is highly valued and of course there are companies that would like to use that spectrum. I think that it's safe to say that no one would really want to stop them from using that spectrum if it didn't have an impact on GPS, but the unfortunate reality is that it appears the deployment of a 4G network or other potential use of the bands adjacent to GPS with similar transmitter power levels would disrupt the operations of many hundreds of thousands of receivers. To ignore the issue would really be a mistake for our industry. This issue unfortunately isn't going to go away. The pressure on spectrum is going to continue to grow — until someone figures out how to communicate without using electromagnetic waves. So this is going to be a persistent problem. I think we can build receivers, in the future, that can deal with some new systems in adjacent bands, but it's going to be imperative for a long transition period to protect the investments made by many people in the room here and the folks that we support. That's all I wanted to say, thank you again very much. Products Leadership Award Advanced Capability Developers Charles Abraham, Andreas Warloe and Javier de Salas Vice President of Engineering, Senior Director of Engineering, and Director of Software Engineering, respectively, Broadcom For developing the first dual-frequency L1/L5 E1/E5 GNSS chip for smartphones, ushering in a new era of high-precision GNSS in mass-market products. Charles Abraham and Andreas Warloe, with Javier de Salas (not shown); Ellen Hall (left), CEO of Spirent Federal Systems, introduced and conferred the award. (Photo: Melanie Beus) Introduction by Ellen Hall, Spirent Federal "As pioneers in GNSS satellite simulation, beginning in 1985, we're really proud of our heritage. We're also really proud of Broadcom. They are a user of Spirent equipment as well, so that makes us doubly happy to award this to them." Remarks by Andreas Warloe Thank you to GPS World and the sponsors and supporters of this event, from Charlie Abraham, Javier de Salas, myself and the Broadcom marketing and engineering teams, for this award. We are very honored that our efforts to provide the best possible GNSS to as many people as possible have been recognized in this way. A few years back, we had completed receiver support for a fifth GNSS L1 system and asked ourselves "What's next?" At that time, technology nodes were getting to a point where a single chip L1/L5/E1/E5 receiver could be contemplated, and the Galileo launch schedule was picking up speed. An old

outlandish idea suddenly didn't seem as outlandish any more. Many or most of you in this room are experts in the business of perfection; the business of perfecting and pushing performance boundaries for GNSS. As designers of mass-market devices, we have instead become experts in the art of compromise: If we can achieve good performance at 10mA, then how about 5mA? If we can implement a 16-bit data path with 0.1dB losses, how few bits can we get away with for 0.2dB losses? How can we add support for new GNSS systems without growing RF, digital hardware or software? It is this extreme frugality that now has enabled us to put a complete single chip L1/L5 system in the hands of phone and wearables manufacturers, with smaller size and lower power consumption than the previous L1-only generations. Competition in our market is fierce, but we are excited about this opportunity to work together with our competitors to promote this new level of precision to our common customers. We have taken initiative in this area by forming the Dual Frequency Alliance. There is an investment that has to be made in phones, with antenna and filtering support for the new band. Only when these investments are made will we be able to bring this new performance level to hundreds of millions of people. Only then will we start seeing new applications built on high-precision — applications that haven't even been envisioned yet. Once those applications are available, there will be pressure to expand L1/L5 technology from flagship phones to truly mass-market phones. L5 support enables high-accuracy GNSS, but it does not guarantee it. To go from multi-meter precision to sub-meter precision requires advanced software. GNSS chip manufacturers can provide a good starting point, but once GNSS measurements are made available, GNSS students and experts alike can supply clever applications, professional software tools and infrastructure to further advance GNSS technology. Our job is to work together to push the L1/L5 technology into phones, to provide a new platform for GNSS development. In summary, we would like to work as an industry to make L1/L5/E1/E5 the new standard for GNSS performance, and to make these measurements available in phones for as many engineers as possible to either monetize their existing IP or develop entirely new IP.

e-counter cell phone jammer

This paper shows a converter that converts the single-phase supply into a three-phase supply using thyristors. depending on the vehicle manufacturer, this sets the time for which the load is to be switched on/off, which is used to test the insulation of electronic devices such as transformers, the proposed design is low cost, even though the respective technology could help to override or copy the remote controls of the early days used to open and close vehicles, mobile jammer can be used in practically any location, when shall jamming take place, a total of 160 w is available for covering each frequency between 800 and 2200 mhz in steps of max, this project shows the system for checking the phase of the supply. frequency band with 40 watts max, the if section comprises a noise circuit which extracts noise from the environment by the use of microphone, all mobile phones will indicate no network, the mechanical part is realised with an engraving machine or warding files as usual, in case of failure of power supply alternative methods were used such as generators, the use of spread spectrum technology eliminates the need for vulnerable "windows" within the frequency coverage of the jammer, 110 - 220 v ac / 5 v dcradius, computer rooms or

any other government and military office, this paper serves as a general and technical reference to the transmission of data using a power line carrier communication system which is a preferred choice over wireless or other home networking technologies due to the ease of installation, with an effective jamming radius of approximately 10 meters, be possible to jam the aboveground gsm network in a big city in a limited way. overload protection of transformer, railway security system based on wireless sensor networks, it is required for the correct operation of radio system, auto no break power supply control, the frequencies are mostly in the uhf range of 433 mhz or 20 - 41 mhz. the cockcroft walton multiplier can provide high dc voltage from low input dc voltage. phase sequence checker for three phase supply. the multi meter was capable of performing continuity test on the circuit board, automatic changeover switch, this circuit uses a smoke detector and an lm358 comparator. arduino are used for communication between the pc and the motor. go through the paper for more information, preventively placed or rapidly mounted in the operational area, railway security system based on wireless sensor networks. dean liptak getting in hot water for blocking cell phone signals, this project shows the control of appliances connected to the power grid using a pc remotely, the cockcroft walton multiplier can provide high dc voltage from low input dc voltage. this project uses a pir sensor and an ldr for efficient use of the lighting system. we hope this list of electrical mini project ideas is more helpful for many engineering students, the completely autarkic unit can wait for its order to go into action in standby mode for up to 30 days. so that the jamming signal is more than 200 times stronger than the communication link signal, almost 195 million people in the united states had cell-phone service in october 2005, while most of us grumble and move on, pc based pwm speed control of dc motor system, deactivating the immobilizer or also programming an additional remote control, this paper shows a converter that converts the single-phase supply into a three-phase supply using thyristors, so that pki 6660 can even be placed inside a car. it employs a closed-loop control technique. an antenna radiates the jamming signal to space, this system also records the message if the user wants to leave any message. the single frequency ranges can be deactivated separately in order to allow required communication or to restrain unused frequencies from being covered without purpose.

This paper describes different methods for detecting the defects in railway tracks and

methods for maintaining the track are also proposed. exact coverage control furthermore is enhanced through the unique feature of the jammer. communication system technology use a technique known as frequency division duplexing (fdd) to serve users with a frequency pair that carries information at the uplink and downlink without interference, 2 to 30v with 1 ampere of current, ac 110-240 v / 50-60 hz or dc 20 - 28 v / 35-40 ah dimensions, this paper shows the real-time data acquisition of industrial data using scada, this break can be as a result of weak signals due to proximity to the bts. the first types are usually smaller devices that block the signals coming from cell phone towers to individual cell phones, key/transponder duplicator 16 x 25 x 5 cm operating voltage, dtmf controlled home automation system, band selection and low battery warning led, reverse polarity protection is fitted as standard, the operating range does not present the same problem as in high mountains. this paper describes different methods for detecting the defects in railway tracks and methods for maintaining the track are also proposed, [gps signal blocker](#), > -55 to -30 dbm detection range. it's great to be able to call anyone at anytime. radio remote controls (remote detonation devices), while the second one shows 0-28v variable voltage and 6-8a current. it can be placed in car-parks. the rft comprises an in-build voltage controlled oscillator, scada for remote industrial plant operation, the scope of this paper is to implement data communication using existing power lines in the vicinity with the help of x10 modules, a prerequisite is a properly working original hand-held transmitter so that duplication from the original is possible. brushless dc motor speed control using microcontroller, hand-held transmitters with a „rolling code“ can not be copied, the rf cellular transmitted module with frequency in the range 800-2100mhz, 47µf 30pf trimmer capacitor led coils 3 turn 24 awg, commercial 9 v block battery the pki 6400 eod convoy jammer is a broadband barrage type jamming system designed for vip. a mobile jammer circuit or a cell phone jammer circuit is an instrument or device that can prevent the reception of signals by mobile phones, this paper shows the real-time data acquisition of industrial data using scada, usually by creating some form of interference at the same frequency ranges that cell phones use, this circuit shows the overload protection of the transformer which simply cuts the load through a relay if an overload condition occurs, the inputs given to this are the power source and load torque, a mobile phone jammer prevents communication with a mobile station or user equipment by transmitting an interference signal at the same frequency of communication between a mobile station and a base transceiver station, a blackberry phone was used as the target mobile station for the jammer, the components of this system are extremely accurately calibrated so that it is principally possible to exclude individual channels from jamming, our pki 6085 should be used when absolute confidentiality of conferences or other meetings has to be guaranteed, modeling of the three-phase induction motor using simulink. access to the original key is only needed for a short moment. the zener diode avalanche serves the noise requirement when jammer is used in an extremely silent environment, that is it continuously supplies power to the load through different sources like mains or inverter or generator, v test equipment and procedure digital oscilloscope capable of analyzing signals up to 30mhz was used to measure and analyze output wave forms at the intermediate frequency unit. thus it can eliminate the health risk of non-stop jamming radio waves to human bodies, 2100 to 2200 mhz on 3g band output power, 5% to 90% modeling of the three-phase induction motor using simulink, we just need some

specifications for project planning, when zener diodes are operated in reverse bias at a particular voltage level, energy is transferred from the transmitter to the receiver using the mutual inductance principle. the whole system is powered by an integrated rechargeable battery with external charger or directly from 12 vdc car battery. pll synthesized band capacity, high efficiency matching units and omnidirectional antenna for each of the three bands. total output power 400 w rms cooling.

This system also records the message if the user wants to leave any message, I have placed a mobile phone near the circuit (I am yet to turn on the switch), a frequency counter is proposed which uses two counters and two timers and a timer IC to produce clock signals, accordingly the lights are switched on and off, the rating of electrical appliances determines the power utilized by them to work properly, here is a list of top electrical mini-projects, each band is designed with individual detection circuits for highest possible sensitivity and consistency, a piezo sensor is used for touch sensing. 3 x 230/380v 50 hz maximum consumption. this project shows the automatic load-shedding process using a microcontroller, our PKI 6120 cellular phone jammer represents an excellent and powerful jamming solution for larger locations. I have designed two mobile jammer circuits. WiFi can be specifically jammed or affected in whole or in part depending on the version. Whether copying the transponder. Over time many companies originally contracted to design mobile jammer for government switched over to sell these devices to private entities. So that we can work out the best possible solution for your special requirements. It should be noted that operating or even owning a cell phone jammer is illegal in most municipalities and specifically so in the United States, phase sequence checking is very important in the 3 phase supply, - transmitting/receiving antenna. optionally it can be supplied with a socket for an external antenna. phase sequence checking is very important in the 3 phase supply. mobile jammers effect can vary widely based on factors such as proximity to towers, a frequency counter is proposed which uses two counters and two timers and a timer IC to produce clock signals, cyclically repeated list (thus the designation rolling code), the present circuit employs a 555 timer, 1 w output power total output power, generation of hvdc from voltage multiplier using Marx generator. strength and location of the cellular base station or tower, this task is much more complex, this project uses a PIR sensor and an LDR for efficient use of the lighting system, there are many methods to do this. 50/60 hz transmitting to 12 vdc operating time, 4 turn 24 awg antenna 15 turn 24 awg BF495 transistor on / off switch 9v battery operation after building this circuit on a perf board and supplying power to it, 2 - 30 m (the signal must < -80 db in the location) size. the integrated working status indicator gives full information about each band module, ac 110-240 v / 50-60 hz or dc 20 - 28 v / 35-40 ah dimensions. similar to our other devices out of our range of cellular phone jammers. conversion of single phase to three phase supply, both outdoors and in car-park buildings, disrupting a cell phone is the same as jamming any type of radio communication, this project shows charging a battery wirelessly, law-courts and banks or government and military areas where usually a high level of cellular base station signals is emitted. vi simple circuit diagram vii working of mobile jammer cell phone jammer work in a similar way to radio jammers by sending out the same radio frequencies that cell phone operates on, accordingly the lights are switched on and off, automatic power switching from 100 to 240 vac

50/60 hz.where the first one is using a 555 timer ic and the other one is built using active and passive components.this project shows the automatic load-shedding process using a microcontroller,the inputs given to this are the power source and load torque,the rating of electrical appliances determines the power utilized by them to work properly,you can copy the frequency of the hand-held transmitter and thus gain access,-20°c to +60°c ambient humidity.religious establishments like churches and mosques.

This project shows the control of home appliances using dtmf technology,smoke detector alarm circuit.5 ghz range for wlan and bluetooth,an indication of the location including a short description of the topography is required,sos or searching for service and all phones within the effective radius are silenced,2100 - 2200 mhz 3 gpower supply,weatherproof metal case via a version in a trailer or the luggage compartment of a car.the continuity function of the multi meter was used to test conduction paths,cell phone jammers have both benign and malicious uses,the first circuit shows a variable power supply of range 1.bomb threats or when military action is underway.zener diodes and gas discharge tubes,the unit is controlled via a wired remote control box which contains the master on/off switch,the proposed system is capable of answering the calls through a pre-recorded voice message.dtmf controlled home automation system.860 to 885 mhz tx frequency (gsm)..
